

SHOCK ABSORBER AIR BAG / HEIGHT VALVE

Newly Developed Heavy-Duty Truck Air Spring with Adjustable Damping and Shock Absorption

This utility model discloses an adjustable resistance shock-absorbing air spring, comprising a shock absorber cylinder. A hollow rod is installed inside the shock absorber cylinder. An adjustment handle is installed at the upper end of the hollow rod. A blocking hole is provided at the lower part of the hollow rod. A piston rod is installed inside the hollow rod. A sealing assembly is installed at the lower part of the piston rod. A resistance adjustment hole is provided at the lower part of the piston rod. A needle roller bearing is installed on the upper side of the hollow rod. The upper side of the piston rod is fixedly connected to a connecting crank via threads. The adjustable resistance shock-absorbing air spring of this utility model allows resistance adjustment manually, ensuring stable vehicle operation under different loads, thereby improving driving experience and safety. The adjustment handle installed at the upper end of the hollow rod enables resistance adjustment in a very simple manner. The needle roller bearing installed between the hollow rod and the connecting crank prevents the connection from being too tight, which would otherwise make it difficult to turn the adjustment handle.
